

Topic B

"The New Astronomy"

Part 3. Kepler's Laws 2 & 3

(Web Version: 10-01-01)

1

Kepler's Second Law

2

Kepler's Second Law

- Alternate Name — *Law of Areas*
- Common Textbook Statement . . .

"The line from the Sun to a planet sweeps out equal areas in equal times"

3

Summary

Equal *areas* in equal *times*

which means

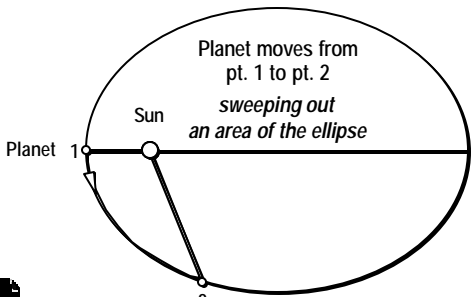

Areas proportional to times

Areas \propto Times

Note: \propto means "proportional to"

4

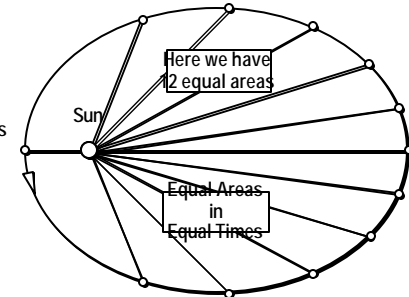

The Area Swept Out

Planet moves from pt. 1 to pt. 2
sweeping out an area of the ellipse

5

Example: Law of Areas

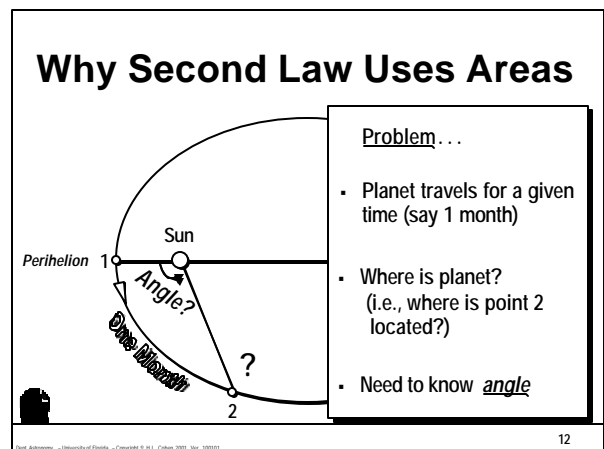

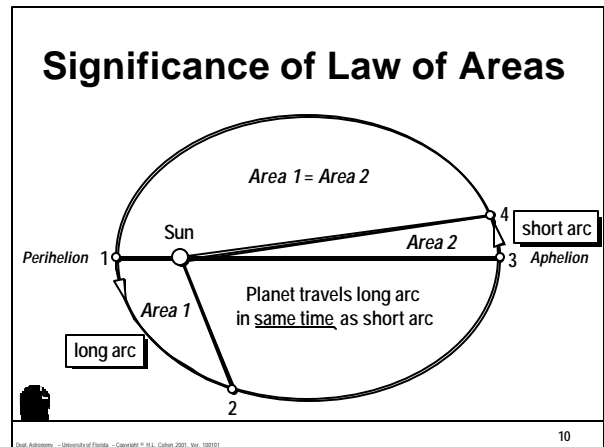

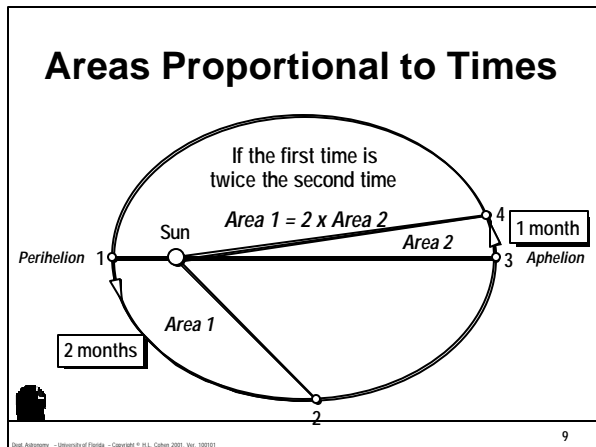

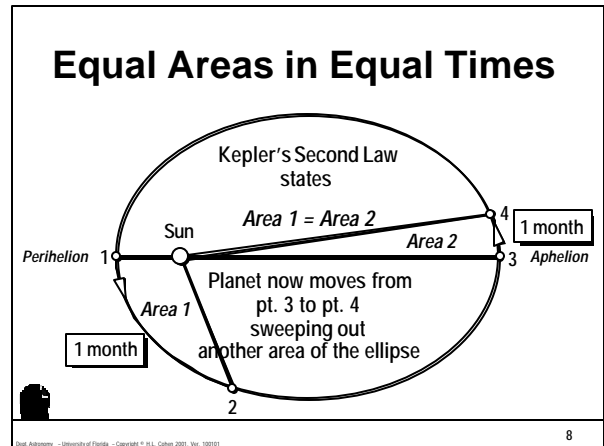

Here we have 12 equal areas

Equal Areas in Equal Times

So time intervals all 1/12 of orbit period

Example
If orbit period 12 months, each time interval is 1 month

6

Need Angle at Sun

- Kepler unable to find angle & time relation
 Angle \nleftrightarrow Time (?)
 > *No relation (formula) known to exist!*
- Only relation known between *areas & time*

Area \propto Time!

13

Law Two "Most Important"

Can't easily find angle

But Second Law can predict planet's position if work with areas!

14

Find Planet — Circular Orbit

- Assume
 - Orbit Period = 12 months
 - Time traveled = 3 months
- Planet initially at pt. 1
- Where is planet now? (where is pt. 2?)
- Answer — 90° from pt. 1
 - 3 months/12 months = 1/4
 - So 1/4 of 360° = 90°

Uniform Motion

15

Find Planet — Elliptical Orbit

- Now . . .
 Where is planet?

Hint
 Planet moves fastest at perihelion

Orbit Period = 12 months
 Time traveled = 3 months

16

Find Planet — Elliptical Orbit

- Now . . .
 Where is planet?
- Answer —

Hint
 Planet moves fastest at perihelion

But precise position requires Law of Areas

17

For Precise Position

- Need areas
- 1/4 orbit period used (3 out of 12 months)
- So want . . .
 Area 1 = ?
 (Hint follows)

Area 1

18

For Precise Position

Hint . . .

How much area swept out if planet moves for one entire period (12 months)?

Area 2 = ?
(Planet goes all the way around)

19

For Precise Position

- Answer . . . ?
- So . . . Area 1 = ? of area of ellipse (travels months out of 12)

Area 2 = ?
Area 1 = ?

20

Are You Creative?

Can you find a *simple* method to determine if Area 1 is correct fraction of entire ellipse area?

Method must be simple enough for a first grader to do!

21

Solution One

Hint!

Draw Ellipse

22

Solution Two

Draw Ellipse

Area 2 = Area Ellipse
Area 1

Plain Paper OK

23

“Dates of Four Seasons”

Demonstrate Law of Areas
Do You Know How?

Winter (Dec 22) Autumn (Sept 23) Summer (June 22)
Perihelion Jan. 3 (fastest) Aphelion July 3 (slowest)
Spring (Mar 21)

24

Kepler's Third Law

David Abney - University of Florida - Copyright © H.L. Cohen 2001. Ver. 100101

25

Kepler's Third Law

- Alternate Name — *Harmonic Law*
- Statement . . .
"The square of the orbit period is proportional to the cube of the mean distance"
- Historical Note — publ. 10 yrs. after others

Published 1619 in "*Harmony of the World*"

26

Summary

Let . . .

P = orbit period, (not *perihelion*)

a = mean distance,

then $P^2 \propto a^3$

Remember \propto means *proportional to*

27

The Solar System

(as known to Kepler)

Planet	Orbit Period	Mean Distance
Mercury	0.24 yr	0.39 AU
Venus	0.62 yr	0.72 AU
Earth	1.00 yr	1.00 AU
Mars	1.88 yr	1.52 AU
Jupiter	11.9 yr	5.20 AU
Saturn	29.4 yr	9.56 AU

Relation?

28

What is Relation?

Planet	Orbit Period	Mean Distance
Mercury	0.24 yr	0.39 AU
Venus	0.62 yr	0.72 AU
Earth	1.00 yr	1.00 AU
Mars	1.88 yr	1.52 AU
Jupiter	11.9 yr	5.20 AU
Saturn	29.4 yr	9.56 AU

Is it simply $P \propto a$?

29

The Solar System

Compare Earth to Jupiter

Planet	Orbit Period	Mean Distance
Mercury	0.24 yr	0.39 AU
Venus	0.62 yr	0.72 AU
Earth	1.00 yr	1.00 AU
Mars	1.88 yr	1.52 AU
Jupiter	11.9 yr	5.20 AU
Saturn	29.4 yr	9.56 AU

P about 12x larger

but *a* only about 5x larger!

30

What is Relation?

Planet	Orbit Period	Mean Distance
Mercury	0.24 yr	0.39 AU
Venus	0.62 yr	0.72 AU
Earth	1.00 yr	1.00 AU
Mars	1.88 yr	1.52 AU
Jupiter	11.9 yr	5.20 AU
Saturn	29.4 yr	9.56 AU

Does not work!

~~$P^2 \propto a^3$~~

Dust Astronomy - University of Florida - Copyright © H.L. Cohen 2001. Ver. 100101 31

What is Relation?

Planet	Orbit Period	Mean Distance
Mercury	0.24 yr	0.39 AU
Venus	0.62 yr	0.72 AU
Earth	1.00 yr	1.00 AU
Mars	1.88 yr	1.52 AU
Jupiter	11.9 yr	5.20 AU
Saturn	29.4 yr	9.56 AU

Kepler finds

$P^2 \propto a^3$

Dust Astronomy - University of Florida - Copyright © H.L. Cohen 2001. Ver. 100101 32

Kepler's Third Law

Compare Earth to Jupiter using $P^2 \propto a^3$

Planet	Orbit Period	Mean Distance
Mercury	0.24 yr	0.39 AU
Venus	0.62 yr	0.72 AU
Earth	1.00 yr	1.00 AU
Mars	1.88 yr	1.52 AU
Jupiter	11.9 yr	5.20 AU
Saturn	29.4 yr	9.56 AU

$\frac{11.9^2}{1.00^2}$ $\frac{5.20^3}{1.00^3}$

Dust Astronomy - University of Florida - Copyright © H.L. Cohen 2001. Ver. 100101 33

Kepler's Third Law

Results same!

Planet	Orbit Period	Mean Distance
Mercury	0.24 yr	0.39 AU
Venus	0.62 yr	0.72 AU
Earth	1.00 yr	1.00 AU
Mars	1.88 yr	1.52 AU
Jupiter	11.9 yr	5.20 AU
Saturn	29.4 yr	9.56 AU

$\frac{141}{1}$ $\frac{141}{1}$

(Results rounded to nearest integer)

Dust Astronomy - University of Florida - Copyright © H.L. Cohen 2001. Ver. 100101 34

Side Note

Need not write 1.0 in denominator if compare to Earth!

Planet	Orbit Period	Mean Distance
Mercury	0.24 yr	0.39 AU
Venus	0.62 yr	0.72 AU
Earth	1.00 yr	1.00 AU
Mars	1.88 yr	1.52 AU
Jupiter	11.9 yr	5.20 AU
Saturn	29.4 yr	9.56 AU

$\frac{11.9^2}{1.00^2}$ $\frac{5.20^3}{1.00^3}$

So write $P^2 = a^3$ if "P" in years, "a" in AU's

Dust Astronomy - University of Florida - Copyright © H.L. Cohen 2001. Ver. 100101 35

All Planets

Try it for yourself

Planet	P (years)	P ²	a (AU)	a ³
Mercury	0.24	0.058	0.39	0.058
Venus	0.62	0.378	0.72	0.378
Earth	1.00	1.00	1.00	1.00
Mars	1.88	3.53	1.52	3.51
Jupiter	11.9	141	5.20	141
Saturn	29.4	864	9.56	874
Uranus	83.8	7,020	19.2	7,080
Neptune	164	26,900	30.1	27,300
Pluto	248	61,500	39.4	61,200

nearly same

Dust Astronomy - University of Florida - Copyright © H.L. Cohen 2001. Ver. 100101 36

Implications of Third Law

Draw

- Earth's orbit
- Pluto's orbit

Notice:
 $a = 40 \text{ AU}$
 but
 $P = 248 \text{ yrs}$
 (not 40 yrs!)

Orbit 40x larger, but *period* 248x!
 (About 6x larger)
 What's going on?
 Hint \Rightarrow

Orbits not drawn to scale

37

Implications of Third Law

Draw

- Earth's orbit
- Pluto's orbit

Notice:
 $a = 40 \text{ AU}$
 but
 $P = 248 \text{ yrs}$
 (not 40 yrs!)

Hint: 2 Racers
 5 min.
 1 min.
 $2R$ R
 ?

Orbits not drawn to scale

38

Implications of Third Law

Draw

- Earth's orbit
- Pluto's orbit

Notice:
 $a = 40 \text{ AU}$
 but
 $P = 248 \text{ yrs}$
 (not 40 yrs!)

Answer: ?

Orbits not drawn to scale

39

Conclusion

Kepler's Third (*Harmonic*) Law implies ...

Two reasons outer planets take longer to orbit

- 1) Orbits *larger*
also
- 2) Average orbit speed *slower*

40

Try Answering This

- Two orbits
- Sizes identical (" a " same)
- Shapes different
 - $e = 0.00$
 - $e = 0.75$
- Which planet takes longer to orbit Sun?

41

Hint ...

- Third (Harmonic) Law is
 $P^2 = a^3$
- Answer ?
 See if you can figure it out

42

Know

- How to use *Third Law*: $P^2 = a^3$
 - Remember — to write *Third Law* as above, must have
 - “P” in years
 - “a” in AU’s
- Be able to find
 - “P” if given “a” use as $P^2 = a^3$
 - “a” if given “P” use as $a^3 = P^2$ } Reverse

See *Study Guide*: Last Two Slides in PowerPoint Handout
 Example Problem 2 & Practice on Topic B Questions

43

Hints: Solving Third Law

- Find “P”: $P^2 = a^3$
 - Either $P = \sqrt{a^3}$ (Cube first)
 - or $P = \sqrt{a \times a \times a} = a\sqrt{a}$ (Sq. root first)
- Find “a”: $a^3 = P^2$
 - Either $a = \sqrt[3]{P^2}$ (Sq. first)
 - or $a = \sqrt[3]{P \times P} = \sqrt[3]{P} \times \sqrt[3]{P}$ (Cube root first)

44

Example: Solving Third Law

- Find “P”: $P^2 = a^3$. . . if $a = 25$ AU
 - Either $P = \sqrt{25^3} = \sqrt{15,625} = 125$ yrs
 - or $P = \sqrt{25 \times 25 \times 25} = 25\sqrt{25} = 125$ yrs
- Find “a”: $a^3 = P^2$. . . if $P = 125$ yrs
 - Either $a = \sqrt[3]{125^2} = \sqrt[3]{15,625} = 25$ AU
 - or $a = \sqrt[3]{125 \times 125} = \sqrt[3]{125} \times \sqrt[3]{125} = 25$ AU

45
